

# Uniform Distribution

The most basic of all the continuous random variables is the uniform random variable, which is equally likely to take on any value in its range  $(\alpha, \beta)$ .  $X$  is a *uniform random variable* ( $X \sim \text{Uni}(\alpha, \beta)$ ) if it has PDF:

$$f(x) = \begin{cases} \frac{1}{\beta - \alpha} & \text{when } \alpha \leq x \leq \beta \\ 0 & \text{otherwise} \end{cases}$$

Notice how the density  $1/(\beta - \alpha)$  is exactly the same regardless of the value for  $x$ . That makes the density uniform. So why is the PDF  $1/(\beta - \alpha)$  and not 1? That is the constant that makes it such that the integral over all possible inputs evaluates to 1.

## Uniform Random Variable

**Notation:**  $X \sim \text{Uni}(\alpha, \beta)$

**Description:** A continuous random variable that takes on values, with equal likelihood, between  $\alpha$  and  $\beta$

**Parameters:**  $\alpha \in \mathbb{R}$ , the minimum value of the variable.  
 $\beta \in \mathbb{R}$ ,  $\beta > \alpha$ , the maximum value of the variable.

**Support:**  $x \in [\alpha, \beta]$

**PDF equation:**  $f(x) = \begin{cases} \frac{1}{\beta - \alpha} & \text{for } x \in [\alpha, \beta] \\ 0 & \text{else} \end{cases}$

**CDF equation:**  $F(x) = \begin{cases} \frac{x - \alpha}{\beta - \alpha} & \text{for } x \in [\alpha, \beta] \\ 0 & \text{for } x < \alpha \\ 1 & \text{for } x > \beta \end{cases}$

**Expectation:**  $E[X] = \frac{1}{2}(\alpha + \beta)$

**Variance:**  $\text{Var}(X) = \frac{1}{12}(\beta - \alpha)^2$

**PDF graph:**

Parameter  $\alpha$ :  Parameter  $\beta$ :

**Example:** You are running to the bus stop. You don't know exactly when the bus arrives. You believe all times between 2 and 2:30 are equally likely. You show up at 2:15pm. What is  $P(\text{wait} < 5 \text{ minutes})$ ?

Let  $T$  be the time, in minutes after 2pm that the bus arrives. Because we think that all times are equally likely in this range,  $T \sim \text{Uni}(\alpha = 0, \beta = 30)$ . The probability that you wait 5 minutes is equal to the probability that the bus shows up between 2:15 and 2:20. In other words  $P(15 < T < 20)$ :

$$P(\text{Wait under 5 mins}) = P(15 < T < 20)$$

$$= \int_{15}^{20} f_T(x) \partial x$$

$$= \int_{15}^{20} \frac{1}{\beta - \alpha} \partial x$$

$$= \frac{1}{30} \partial x$$

$$= \left. \frac{x}{30} \right|_{15}^{20}$$

$$= \frac{20}{30} - \frac{15}{30} = \frac{5}{30}$$

We can come up with a closed form for the probability that a uniform random variable  $X$  is in the range  $a$  to  $b$ , assuming that  $\alpha \leq a \leq b \leq \beta$ :

$$P(a \leq X \leq b) = \int_a^b f(x) dx$$

$$= \int_a^b \frac{1}{\beta - \alpha} dx$$

$$= \frac{b - a}{\beta - \alpha}$$
